## Loma 'meats' High Standards of Metal Detection

Loma Systems, the leading manufacturer of checkweighers, metal detectors and X ray systems has teamed up with VEMAG, a well-known supplier to the meat industry, to introduce a state of the art metal detection system specifically for sausage production lines.

Adding to Loma's successful PipeLine range, the compact VEMAG pipeline guarantees outstanding levels of performance, delivering accurate metal detection checks to ensure that the highest quality product reaches consumers.

With a pipeline that fits comfortably on a standard hinge of the meat pump and with a fully integrated drive unit this metal detector performs to a high standard when checking for metal contaminants in the sausage production line before it is fed through to a VEMAG machine. If any contaminants are detected, they are rejected quickly and efficiently. The system also benefits from an easy release handle to enable detachment for cleaning purposes and software that tracks changes in product conductivity.

Impressively the launch of the system has resulted in nine orders in its first week as Chris Kaine, Loma Systems Group Product Director explains. " We are all extremely excited about the new VEMAG pipeline. The already positive response clearly highlights that we are meeting market need. This advanced system provides manufacturers with the assurance that their product will deliver high levels of quality to consumers".
